DIGITAL SIGNATURE ALGORITHM

AIM:

To implement Digital Signature Algorithm (DSA) using C.

ALGORITHM:

1. Get the prime number p and its divisor q from the user.
2. Get the value of h from the user.
3. Compute the value of g .
4. Get the private key x_a from the user.
5. Compute the user's public key y .
6. Get the per-message secret key k and hash value of message M .
7. Compute the value of z using g , k & p
8. Compute $z \% q$ to get the value of r
9. Compute the multiplicative inverse. 10. Compute the value of s .
10. Print the signature (r, s) .

PROGRAM:

```
#include <stdio.h> #include <math.h> int
power(int,unsigned int,int); int
multiplicativeInverse(int,int,int); int main()
{
int p,q,h,g,r,s,t,x,y,z,k,inv,hash;
printf("\nEnter prime number p and enter q prime divisor of (p-1): "); scanf("%d
%d",&p,&q);
printf("\nEnter h such that it greater than 1 and less than (p-1): ");
scanf("%d",&h); //Compute g t = (p-1)/q; g = power(h,t,p);
printf("\nEnter user's private key such that it is greater than 0 and less than q : "); scanf("%d",&x);
//Computer user's public key y
= power(g,x,p);
printf("\nEnter user's per-message secret key k such that it is greater than 0 and less than q : ");
scanf("%d",&k); printf("\nEnter the hash(M) value : "); scanf("%d",&hash);
//Signing. Compute r and s pair z = power(g,k,p);
r = z % q;
```

```

inv = multiplicativeInverse(k,q,p); s = inv * (hash + x * r) % q;
//Display
printf("\n*****Computed Values*****"); printf("\ng = %d",g);
printf("\ny = %d",y); printf("\nGenerated Signature Sender = (%d, %d)
\n",r,s);
} int power(int x, unsigned int y, int
p)
{
int res = 1; // Initialize result
x = x % p; // Update x if it is more than or equal to p while (y > 0) {
// If y is odd, multiply x with result if (y & 1) res
= (res * x) % p;
// y must be even now y = y >> 1; // y = y/2 x = (x * x) % p;
}
return res;
} int multiplicativeInverse(int a, int b, int
n)
{ int sum,x,y;
for(y=0;y<n;y++)
{
for(x=0;x<n;x++)
{
sum = a * x + b * (-y); if(sum == 1) return
x;
}
} }

```

OUTPUT:

```

➔ ~ ./a.out
Enter prime number p and enter q prime divisor of (p-1): 1279 71
Enter h such that it greater than 1 and less than (p-1): 3
Enter user's private key such that it is greater than 0 and less than q : 15
Enter user's per-message secret key k such that it is greater than 0 and less than q : 10
Enter the hash(M) value : 123

****Computed Values****
g = 3
y = 3
Generated Signature Sender = (0, 62)
➔ ~ 

```

RESULT:

Thus, a C program is implemented to demonstrate Digital Signature Algorithm.
